

Business Insights Report

Retail Sales Analysis Dashboard

This document summarizes the key findings obtained from the Retail Sales Analysis Dashboard built using Power BI, SQL, and Excel. The dashboard analyzes retail transactions to identify trends in revenue, customer demographics, and product performance.

1. Monthly Sales Trend

Sales fluctuate throughout the year with several noticeable peaks, indicating seasonal demand and periods of higher customer activity. Monitoring these trends helps with inventory planning and promotional campaigns.

2. Product Category Performance

Grocery products generated the highest revenue, followed by Home Decor and Electronics. Clothing contributed the lowest total revenue among the displayed categories, suggesting an opportunity for targeted marketing or product optimization.

3. Customer Demographics

Revenue is relatively balanced between male and female customers, indicating that both customer groups contribute significantly to overall sales.

4. Age Group Analysis

Customer spending varies across age groups, with certain age ranges contributing more revenue than others. This insight can help businesses focus marketing efforts on high-value customer segments.

5. Quantity vs Revenue

A positive relationship exists between quantity purchased and total revenue. However, some transactions with similar quantities generated different revenue, reflecting differences in product pricing.

6. Business Recommendations

- Focus promotions on high-performing categories such as Groceries and Home Decor.
- Investigate strategies to improve sales in lower-performing categories.
- Plan inventory around months with higher demand.
- Use customer demographic insights for targeted marketing campaigns.
- Continue monitoring sales trends through interactive dashboards for data-driven decision making.

Tools Used: Power BI, SQL, Microsoft Excel
